

ifRegistry

Implemented By

- [roRegistry](#)

Supported Methods

- [GetSectionList\(\)](#) as Object
- [Delete\(section as String\)](#) as Boolean
- [Flush\(\)](#) as Boolean

Description of Methods

[GetSectionList\(\)](#) as Object

Returns an [roList](#) with one entry for each registry section. Each element in the list is an [roString](#) containing the name of the section. The section itself can be accessed by creating an [roRegistrySection](#) object using that name.

[Delete\(section as String\)](#) as Boolean

Deletes the specified section and returns an indication of success.

[Flush\(\)](#) as Boolean

Flushes the registry out to persistent storage.
