

roSocketEvent

An `roStreamSocket` or `roDataGramSocket` object sends the `roSocketEvent` to indicate a change in the status of the socket. The socket must enable specific event notifications via the `notify` methods of `ifSocketAsync`.

GetSocketID() as Integer

Returns the ID of the socket this event is for. The ID of a socket can be obtained from `ifSocketAsync.GetID()`.

Use `ifSocketStatus` or `ifSocketConnectionStatus` on the indicated socket to query the new status for the socket.
